

CS 112 - Fall 2012, Lab 03

Haohan Zhu

Random Class

- <http://docs.oracle.com/javase/7/docs/api/java/util/Random.html>
- Create an object for **Random()**
 - `Random r = new Random();`
- Use method **.nextInt(n)** to generate a pseudorandom, uniformly distributed int value between 0 (inclusive) and the specified value **n** (exclusive)

Evaluation by Time

- <http://docs.oracle.com/javase/7/docs/api/java/lang/System.html>
- **System.nanoTime();**
- **System.currentTimeMillis();**

Practice: Inversion

- Let `int A[]` be an array of distinct integers. There are `len = A.length` distinct integers.
- If $i < j$ and $A[i] > A[j]$, then the pair (i, j) is called an inversion of A .
- There exists many such pairs in A . Compute how many inversions in A .

Practice: Inversion

- Intuitive method: $O(n^2)$

1	3	2	5	7	4	6	8
---	---	---	---	---	---	---	---

1	3	2	5	7	4	6	8
---	---	---	---	---	---	---	---

1	3	2	5	7	4	6	8
---	---	---	---	---	---	---	---

1	3	2	5	7	4	6	8
---	---	---	---	---	---	---	---

Practice: Inversion

- Maximal number of inversions ?
- Find an efficient algorithm
- When the array is partly sorted, to determine how many inversions are caused by a number, we do not need to compare every pair of numbers. For instance, in array $\{1,3,5,7,2,4,6,8\}$, consider the number of inversions caused by 2.

Practice: Inversion

- Use the process similar to merge sort

1	3	2	5	7	4	6	8
---	---	---	---	---	---	---	---

1	3	2	5	7	4	6	8
---	---	---	---	---	---	---	---

1	3	2	5	7	4	6	8
---	---	---	---	---	---	---	---

1	3	2	5	7	4	6	8
---	---	---	---	---	---	---	---
